

Do you have experience in freight forwarding applications?

Hi, I'm looking for a developer to build a custom freight forwarding and cargo consolidation management system.

I currently use EZ Freight. I want something with similar core functionality, but much simpler, cleaner and tailored to our operation.

The system would be web-based and should include:

- * Admin and agent profiles
- * Warehouse receipts
- * Cargo labels
- * Barcode/QR functionality
- * Cargo dimensions, weight, cubic feet and CBM calculations
- * Consolidation of multiple warehouse receipts into shipments
- * Bills of lading
- * B/L statuses such as Draft, On Hold, Released and Cancelled
- * Shipping manifests generated from the B/L information
- * Vessel/voyage and container information
- * Basic freight/charge calculations
- * Document/PDF generation and printing
- * Search and shipment history
- * Different staff user roles and permissions
- * Audit trail showing who created or changed records

I also need an Agent Portal. Our agents should have their own secure login where they can access the shipments assigned to them, retrieve/download bills of lading and other documents, view shipment information and see whether a B/L has been placed on hold.

If a B/L is on hold, the system should restrict access/release until it is cleared by an authorized user.

I am not looking for a full enterprise system like Magaya. I want the important freight forwarding and consolidation functions in a straightforward system that is easy for our staff and agents to use.

It should work well on desktop, tablet and mobile.

Is this something you have experience developing? If so, please let me know what technology you would recommend, your estimated development time and cost, and whether you have built any freight, logistics, warehouse or shipping systems that I can review.

Is this something you would be able to handle?

I'm not sure if barcodes are necessary

Also, will there be monthly fees associated with this apart from my webhosting fees?

I would like to see an estimate so that I can consult with my board before proceeding

I am not tech savvy and would need advice from IT as well

"Hello Ma'am! That is completely understandable and a very wise approach. Having your IT team and board review the structural plan ensures we build everything aligned with your organization's exact standards.

Here is the complete Estimate & Project Roadmap for your internal review:

Project Scope & Tech Stack Summary

System Type: Custom Freight Forwarding & Cargo Consolidation Web Application
(Mobile/Tablet/Desktop Responsive).

Recommended Architecture: Node.js / Laravel Backend with React.js Frontend & PostgreSQL Database (Ensures security, speed, and clean audit logs).

Core Capabilities: Warehouse Receipts, CBM/Cubic Feet calculations, Master Bill of Lading (B/L status & hold controls), Shipping Manifests, PDF Generation, Role-Based Access, and a Dedicated Secure Agent Portal.

Recurring Software Fees: \$0 (No monthly SaaS platform fees; hosted directly on your own infrastructure)

Would there be additional costs with the barcode? If so, how much?

If we had to do a customer portal, what would be the

Any tracking/status mechanism, where we can mark shipments in transit, landed at port, etc!

Will there be a limit on the user logins? Agents? Staff? admin?

One final question... if I want my manifest exported in particular xml or csv formats... can that be arranged?

1. Would it still take 3-4weeks?
2. What information/accounts/requirements would be needed to start the project?
3. When can we start?
4. Is there a questionnaire to complete?

5. Data storage? How would that work?

Brand colors: are the logo colors, white, charcoal and navy

Our labels are printed on 4x6 rolls

This is a dummy manifest. Our options for this is both landscape and portrait

You said there would be a questionnaire
